

## DC-DC Converter Control Circuits

### DESCRIPTION

The IL34063S1 Series is a monolithic control circuit containing the primary functions required for DC-to-DC converters. These devices consist of an internal temperature compensated reference, comparator, controlled duty cycle oscillator with an active current limit circuit, driver and high current output switch. This series is specifically designed for incorporating in Step-Down and Step-Up and Voltage-Inverting applications with a minimum number of external components.

### BLOCK DIAGRAM

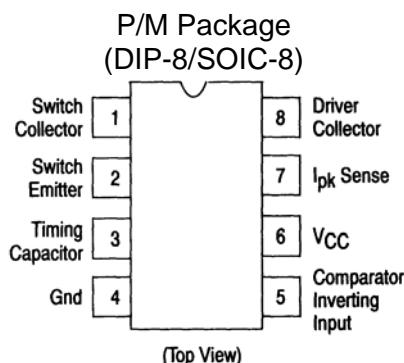

### FEATURES

- Operation from 4.0 V to 40 V Input
- Low Standby Current
- Current Limiting
- Output Switch Current to 0.8 A
- Output Voltage Adjustable
- Frequency Operation to 32 kHz  
( $C_T=1\text{nF}$ )
- Precision 2% Reference

### APPLICATIONS

- Chargers
- Adaptors
- Mother Board
- Scanner

### PIN CONFIGURATION

## ORDERING INFORMATION

Device	Temperature Range	Package
IL34063S1N	0° to 70+°C	DIP-8
IL34063S1D	0° to 70+°C	SOIC-8

## PIN DESCRIPTION

Pin Number	Pin Name	Function
1	Switch Collector	Internal switch transistor collector
2	Switch Emitter	Internal switch transistor emitter
3	Timing Capacitor	Timing Capacitor to control the switching frequency
4	Ground	Ground pin for all internal circuits
5	Comparator Inverting Input	Inverting input pin for internal comparator
6	Supply Voltage	Voltage supply
7	Ipk Sense	Peak Current Sense Input by monitoring the voltage drop across an external I sense resistor to limit the peak current through the switch
8	Driver Collector	Voltage driver collector

## NOTES:

1. Maximum package power dissipation limits must be observed.
2. Low duty cycle pulse techniques are used during test to maintain Junction temperature as close to ambient temperature as possible
3. If the output switch is driven into hard saturation (non Darlington configuration) at low switch currents (< 300 mA) and high driver currents (>30 mA), it may take up to 2.0 µs to come out of saturation. This condition will shorten the off' time at frequencies > 30 kHz, and is magnified at high temperatures. This condition does not occur with a Darlington configuration, since the output switch cannot saturate. If a non Darlington configuration is used, the following output drive condition is recommended

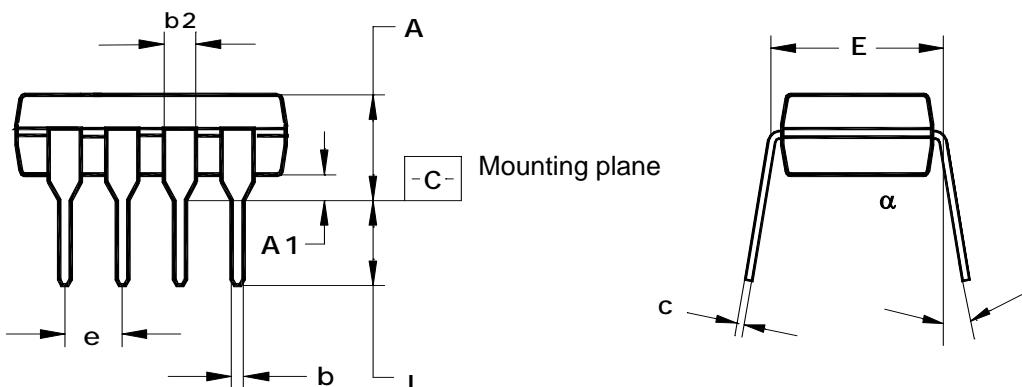

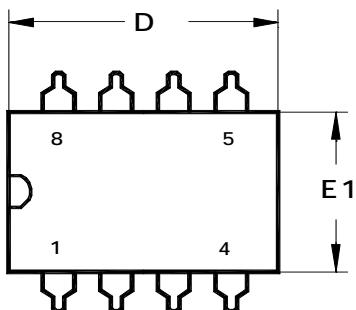

Forced β of output switch = I<sub>C</sub>, output/(I<sub>C</sub>, driver -7.0 mA\*) > 10

\*The 100 Ω. resistor in the emitter of the driver device requires about 7.0 mA before the output switch conducts

\*\*Possible version for shipment
